Halimeter Patient Instructions

Dr. Stuart J Froum

Name _____

Appointment _____

www.drstuartfroum.com

Halimeter® is the internationally recognized standard clinical instrument, used in the diagnosis and treatment of chronic halitosis (oral malodor).

You could be one of the millions who suffers from chronic bad breath (halitosis, oral malodor). Studies indicate that 25 to 85 million people are affected.

The fact is, dentists at an American Dental Association Conference reported that they faced a minimum of six patients with bad breath every week. Calculating the number of practicing dentists, that adds up to at least 500,000 bad breath cases weekly!

Here's another good reason to get tested: Chronic malodor (bad breath) may go undetected and could indicate more serious dental conditions.

It is a simple procedure and the testing is quick and painless. In no time at all, you will know whether or not you have a bad breath problem. Reminder bring in your completed diet diary on your test date.

For the most accurate test results Dr. Stuart J Froum recommends that you refrain from food, smoking, drinking, chewing gum, mints (water is allowed) and any oral hygiene, brushing, flossing oral rinses for 3-4 hours before the test.

Alcohol, toothpaste or mouthwash residue remaining in the mouth when taking breath samples, will result in erroneous reading.

Recommended measures to use to treat your condition

- Diet
- Tongue cleaner
- Oral care products _____
- PeriActive/Peridex (rinse) ____ @day
- Manual / Electric toothbrush ____ @day
- Floss
- Periodontal cleaning
- Other _____
- _____
- _____

If Dr. Froum recommends further treatment, you can be sure that the additional therapy to control bad breath will not be a temporary solution, but will bring you long-term relief. He will be able to monitor the progress of treatment, using the Halimeter®
